

Grand Valley Power
Rate TWS
Transmission Wheeling Service

Availability:

Available to independent power producers (also referred to as “merchants”) operating generation facilities located within GVP territory, for the transportation of electricity across the Cooperative’s 69kV transmission system to the bulk electric system.

Applicability:

Wheeling service requests will be evaluated on a case-by-case basis and will be limited by availability of transmission system capacity. GVP, as the incumbent utility with native load service obligations, will in its sole discretion determine the amount of available excess transmission system capacity based on GVP's existing and forecasted customer loads. Any available transmission capacity in excess of GVP's native load requirements may be made available to merchants requesting service under this rate schedule on a first-come, first-served basis. This rate has been developed for wholesale power transactions and GVP will not wheel non-GVP merchant power to its retail customers under this rate.

This Transmission Wheeling rate schedule is available to entities owning generating facilities that meet the following criteria:

- The entity’s generating facility is or will be connected to GVP’s Transmission system; and
- The entity has a power purchase (offtake) agreement for the output of the generating facility with an entity other than GVP; and
- Power delivery under this agreement occurs at a location outside of the GVP Service Territory.

Type of Service:

Three-phase at existing voltages.

Rate:

Wheeling service will be provided based on the merchant’s Transmission Demand at the following rate:

Transmission Wheeling Charge:	\$4.08/kW-Month
-------------------------------	-----------------

The merchant’s Transmission Demand shall be the maximum rate at which energy is used, measured in kilowatts (kW), for any period of fifteen (15) consecutive minutes during each month for which service is received and a bill is rendered, as determined by the Cooperative's metering equipment at the consumer's metering point, and adjusted for power factor as provided below.

The rate does not include any applicable franchise fees or taxes, which shall be charged separately.

Power Factor:

The merchant agrees to maintain unity power factor as nearly as practicable. Demand charges will be adjusted for consumers to correct for average power factors lower than 90%. Such adjustments will be made by increasing the measured demand 1% for each 1% by which the average power factor is less than 90%.

Conditions of Service:

1. Merchants shall comply with the Cooperative's interconnection standards and policies.
2. This tariff only provides for the transportation of electricity across the Cooperative's transmission system. It is the customer's responsibility to obtain any needed electric transportation services outside of the Cooperative's system.
3. Generators must be three-phase.
4. All wiring, poles, lines, and other electrical equipment on the merchant side of the metering point shall be considered the distribution system of the merchant and shall be furnished and maintained by the merchant unless otherwise specified in the contract for service.
5. The entity taking wheeling service under the rate schedule shall execute a Transmission Wheeling Agreement (TWA).

Terms of Payment:

Will follow GVP's General Rules and Regulations.

Electric Service Regulations:

Service under this schedule will be in accordance with the terms of the Rules and Regulations of the Cooperative as approved by the Cooperative's Board of Directors.
